

Take off with Math and Science!

Everything is engineered, so with a math and science background you can build anything from iPods to airplanes. As soon as Kelly Ortberg saw one of his designs installed in a fighter aircraft, he chose airplanes.

Today, he leads Rockwell Collins and the development of aviation electronics systems for commercial aircraft, including avionics for the next generation of Boeing airplanes.

The Dubuque, Iowa, native and University of Iowa graduate credits his math and science education for giving him opportunities for high-paying jobs and the chance to see the world.
